Erie VT Motorized Zone Valve with AG/AH Actuators

Valve Specifications

 Media
 Hot and chilled water

 Media temperature range
 .0° to 93°C

 Max. Glycol concentration
 50%

 Pressure class
 .PN20 (300 psi)

 Seat Leakage
 .0.01% (EN60534-4/ANSI class IV)

 ΔPm
 100 kPa

 Materials

 Body
 Brass

 Stem
 Nickel-plated brass

 Seat
 Brass

 Paddle/stem o-rings
 Buna-N/EPDM

 It is the responsibility of the installer or product

 specifier to verify media compatibility of the valves

 construction materials with the supplier of water

 treatment/heat transfer solution

Actuator Specifications

Actuator Specifications
Supply voltage
Power consumption 6.5 W, 7.5 VA
End switch 24-240 Vac (101/mA min. to 5 A)
9-30 Vdc (100 mA max.)
Control On/Off, 2 position, spring return
Full running time 30 sec (50 Hz)
9 sec (S.R. function)
Enclosure IP31 Materials
Base plate Stainless Steel
Cover Aluminium
Temperature Limits
Shipping and storage40 to 71°C
Media 0° to 93°C at 40°C ambient temp
Humidity 5 to 95% RH, non-condensing

Schneider Electric's industry leading Erie Zone valve and actuators are suitable for the control of hot and chilled water in terminal unit applications.

The VT valve's high flow capacity paddle design provides a low pressure drop fluid control. The AG/AH actuator's unique 'pop-top' connection allows for a quick and simple installation. The AG (General Close Off) and AH (High Close Off) are spring return actuators designed for two position control. Both spring return open and spring return closed functions are available. All Normally Closed actuators feature a manual override lever.

Weights

Valve bodies

1/2"	410 g 500 g
AG/AH without end switch	_

European Community: EMC Directive (89/336/EEC). Low Voltage Directive (72/23/EEC)

Pressure Equipment Directive (97/23/EC)

UL873: Underwriters laboratories (File #E9429 Catagory Temperature Indicating and Regulating Equipment)

CUL: UL Listed for use in Canada by Underwriters Laboratory. Canadian Standards C22.2 No. 24 Australia: This product meets requirements to bear the C-Tick Mark according to the terms specified by the Communications Authority under the Radio Communications Act of 1992.

Recomendations

It is recommended to fit a strainer upstream of the valve to increase reliability and to follow water treatment guidelines as detailed in VDI 2035. Valves should be installed in the return pipe to reduce exposure to media temperature extremes.

Theory of Operation

The Erie Pop Top actuators are two-position valve series with spring return actuators. When powered, the actuator moves to the desired end stop position, tensing the spring return system. When power is removed the actuator returns to the normal rest position. The Erie AG/AH Pop Top series actuators can be purchased with a built in auxiliary SPDT end switch for interfacing or signaling the end stop valve position to other equipment.

Maintenance

PopTop Series two position spring return valves are maintenance free. Replace defective modules. Actuator may be replaced without removing the valve. Regular maintenance of the total system is recomended to assure sustained, optimum performance.

3/4 Rp	43	23	37	92	102
1Rp	47	25	43	94	105

MOUNTING

The Erie motorized zone valve may be mounted in horizontal or vertical piping configurations.

When installed in horizontal piping, the actuator must be above the valve body. The actuator can be tilted left or right, but it must not be tilted below 85° from vertical.

Installation Considerations

Install the valve so that the paddle closes against the direction of flow. Flow is from A to B. When installing the actuator to a normally closed valve, place the actuator in the manually open position using the manual operating lever. The first time the valve is operated electrically, the manual operating lever of the actuator transfers to the automatic position. Use the manual operating lever to flush the system after installation. The vaves are designed for application in closed hydronic heating and cooling systems. High levels of dissolved oxygen and chlorine found in open systems may attack the valve materials and result in premature failure. Install over a drip pan if condensation in chilled water applications occurs.

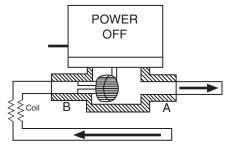

CAUTION

Do not use in systems that have substantial make-up water (open systems). Follow proper water treatment practices and system procedures.

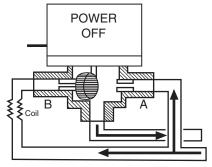

NOTE

- Three-way valves always require a normally closed actuator.
- Three-way valves are always closed at the B port when no power is applied to the motor.
- On power-up, the valve closes to A port on three-way valves.
- Orientate the three-way valve body as needed for normally open or normally closed flow through the coil.

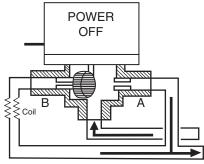

Application Examples

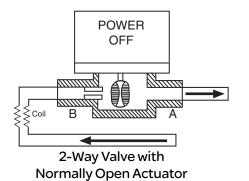

2-Way Valve with Normally Closed Actuator

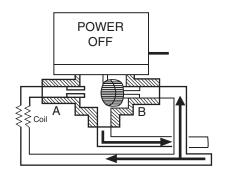

3-Way Valve in Mixing Configuration, Normally Closed to the Coil

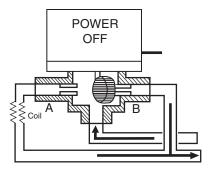

3-Way Valve in Diverting Configuration, Normally Closed to the Coil

3-Way Valve in Mixing Configuration, Normally Open to the Coil

3-Way Valve in Diverting Configuration, Normally Open to the Coil

NOTE

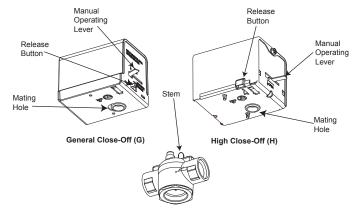

Three-way N.O. applications can be achieved when using a N.C. actuator, by piping the valve in reverse. The three-way examples above show normally closed actuators.

Threaded Connections:

Apply Teflon tape to all but the last two threads of male pipe thread. Hand screw the pipe into the valve, turning it as far as it will go. Use a wrench to fully tighten the valve to the pipe. Do not over tighten or strip the threads.

Installing the Actuator Onto a Valve Body

Slowly latch the manual operating lever in the open, engaged position (AG1 or AH1 only). Depress the release button. Align the body with the actuator to ensure the stem is inserted into the large mating hole on the bottom side of the actuator. Engage the actuator on the body and release the button.

CAUTION

Do not use the valve body to manually open the actuator as damage to the valve actuator will result.

Installation Checks

- 1. Make sure the valve stem rotates freely before and after installing the actuator.
- 2. If the stem does not operate freely it may indicate that the stem was damaged and may require replacement of the valve.
- 3. After the piping is under pressure, check the valve body and the connections for leaks.
- 4. After the valve and actuator are installed, power the actuator and check the operation.
